ACF/Metabox/JetEngine/Toolset/Pods Integration with Ninja Tables

Advanced Integration Settings (Dynamic Post Data Settings) · https://www.ninjatables.com/docs/acf-metabox-jetengine-toolset-pods-integration-with-ninja-tables/

JetEngine is used for Custom post types and relations between these post types.

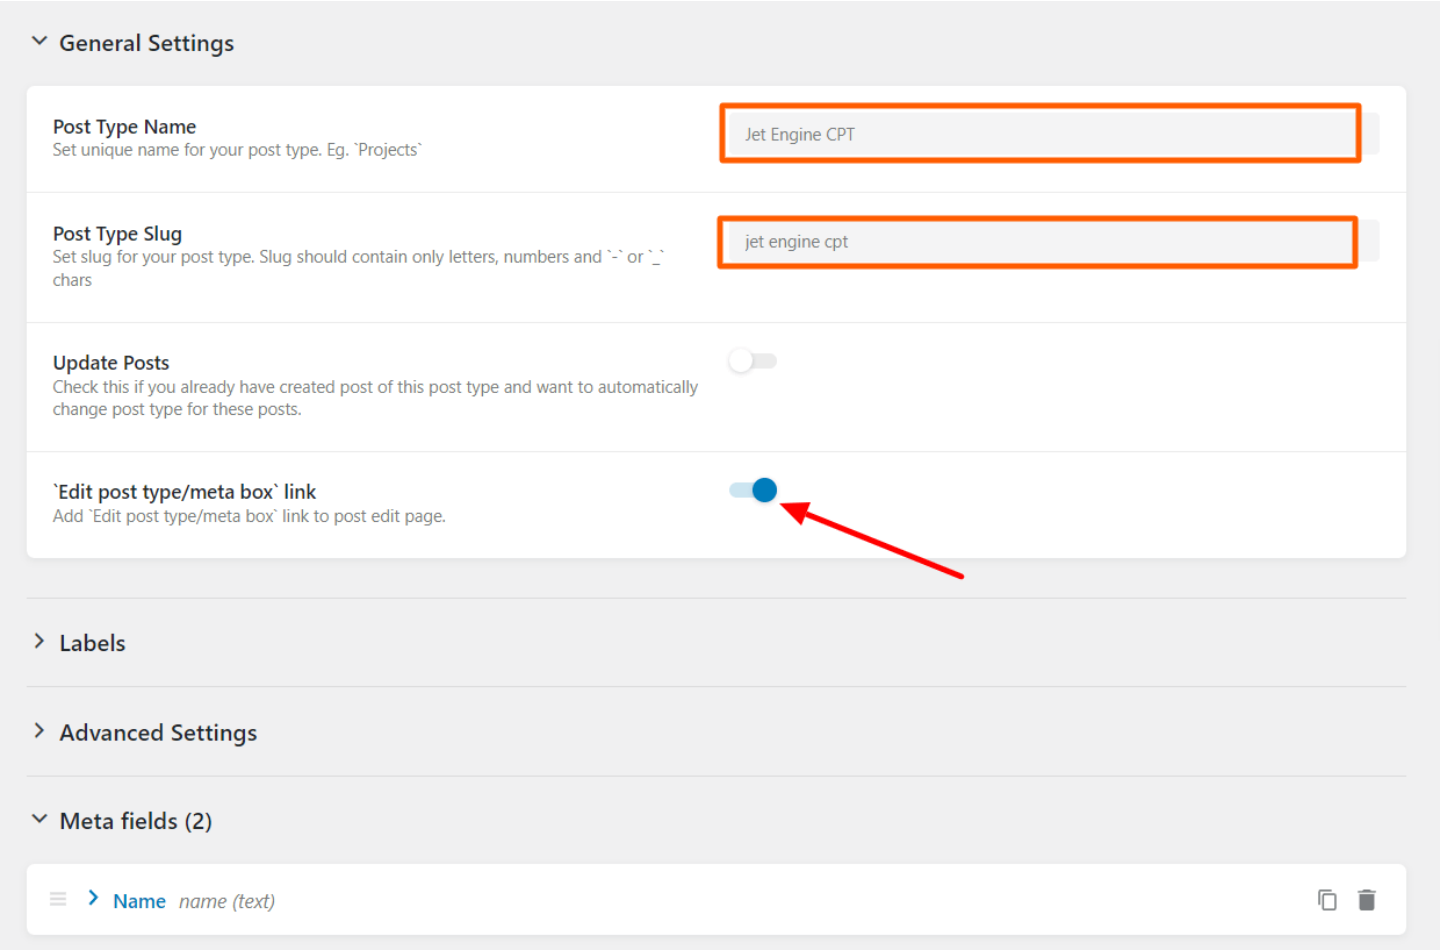

Let’s have a look at how JetEngine Integration works in Ninja Tables.

- To build a Custom Post type, you must have the **JetEngine** Plugin installed first.
- Then, you need to create a **New Post type,** or you can also work on the existing **Post Type**.
- Go to the **JetEngine dashboard →** click on **Post Types,** and **General Settings** will appear.

Add New Post Type

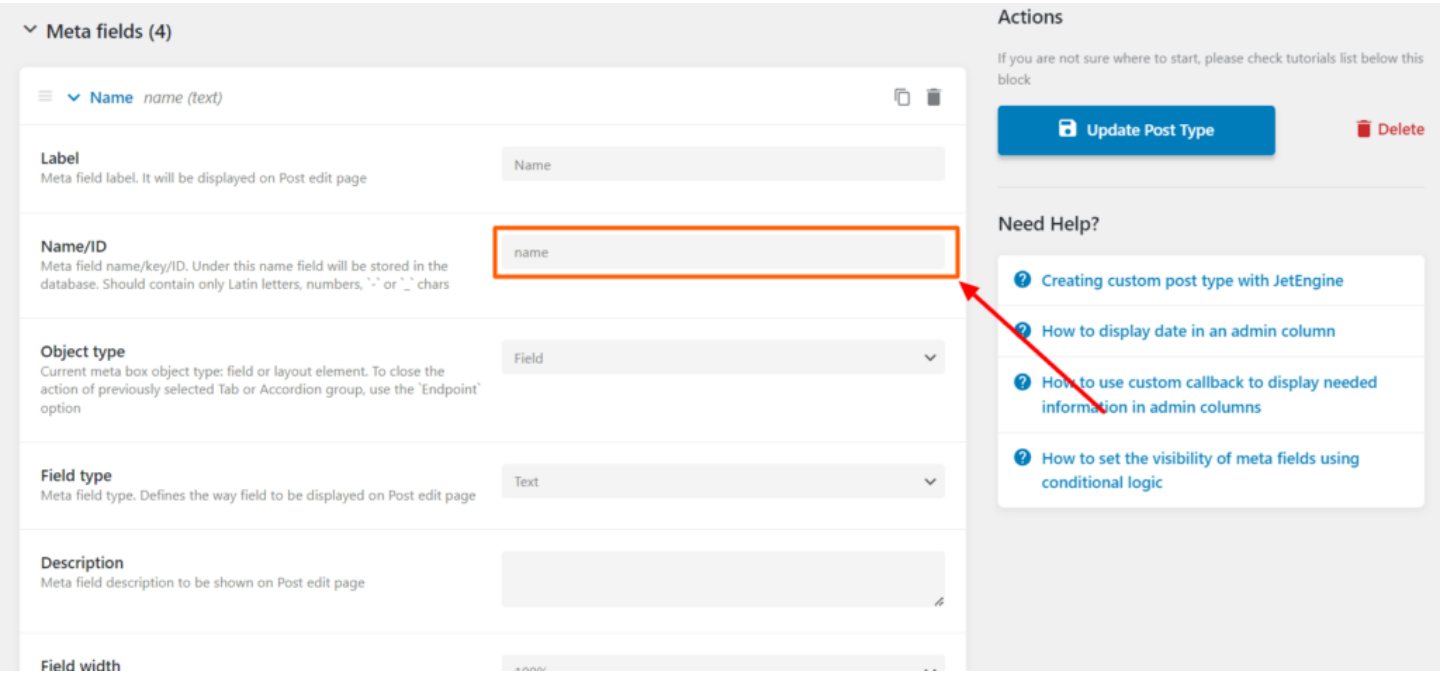

- You must add some **Custom Fields** to the Custom Post Type.
- Give your Post Type Name and Post Type Slug and enable the Edit Post type/meta box link.

General Settings

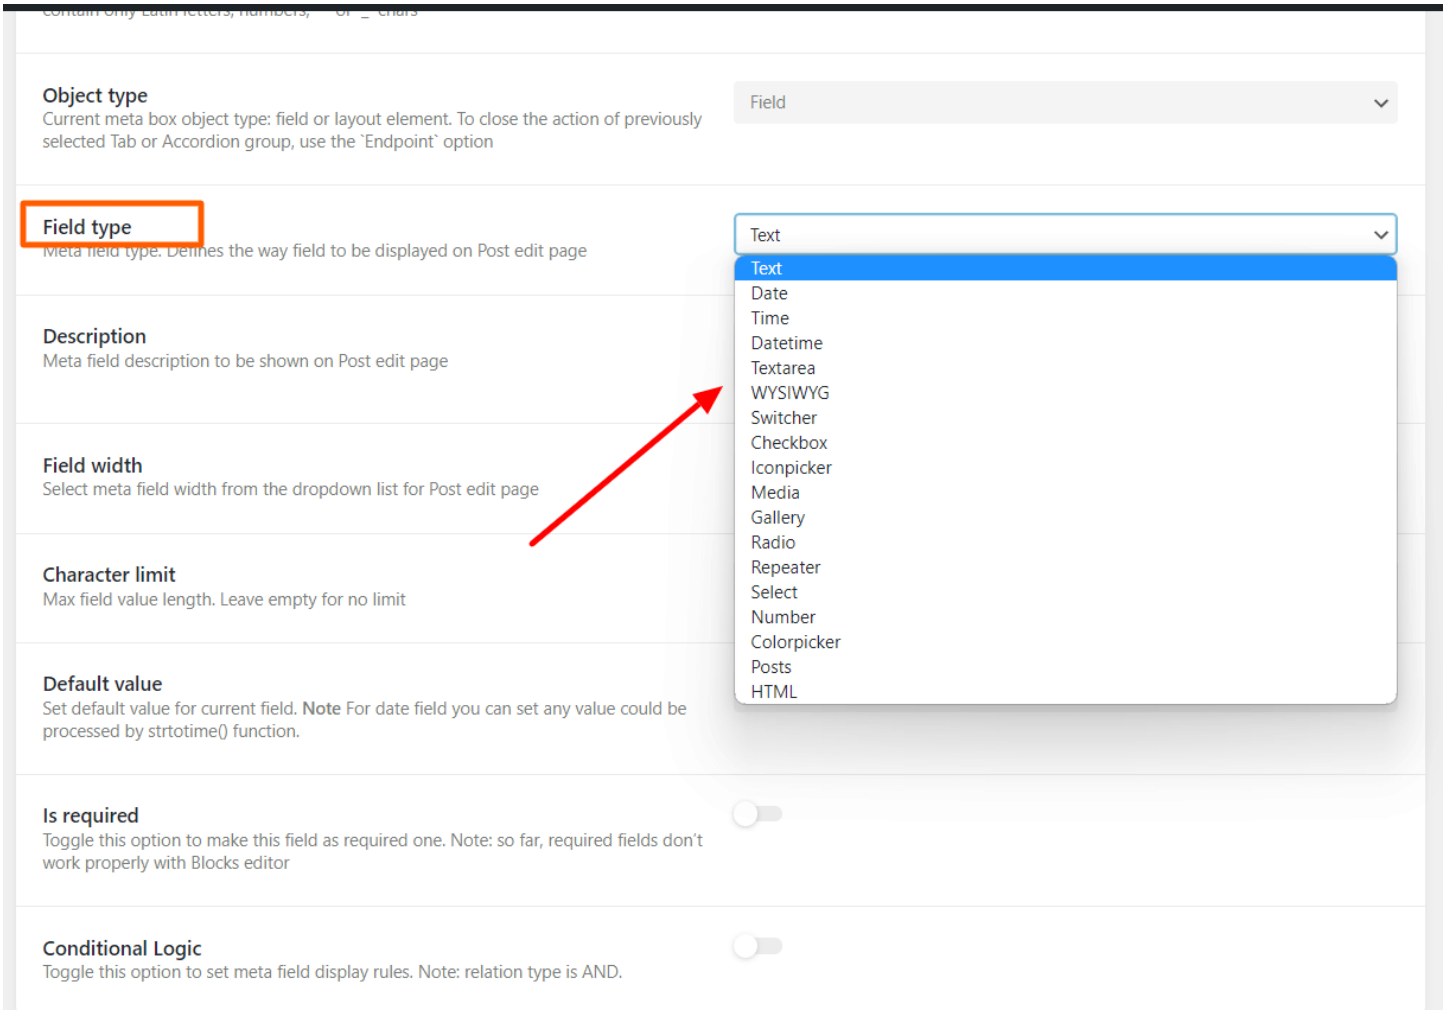

- Also, go to the **Labels** & **Advanced Settings** & give the fields name according to your needs.

- Click on the **New Meta Field** button to add Meta Fields

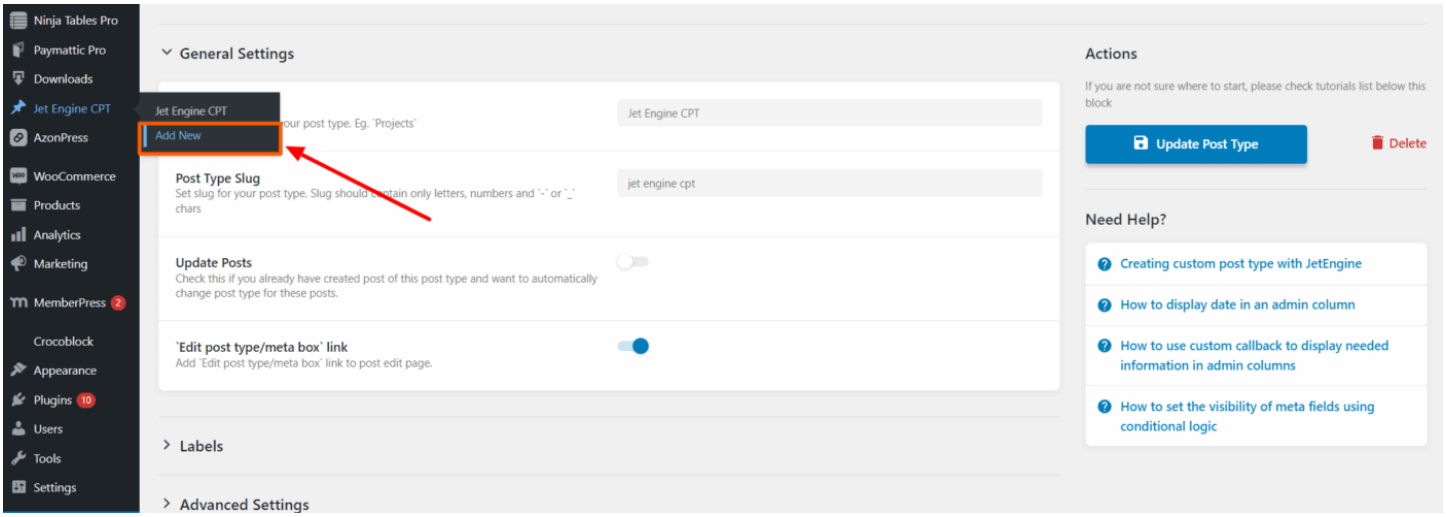

New Meta Field

- There are available **Field types** where you can choose one according to your needs.

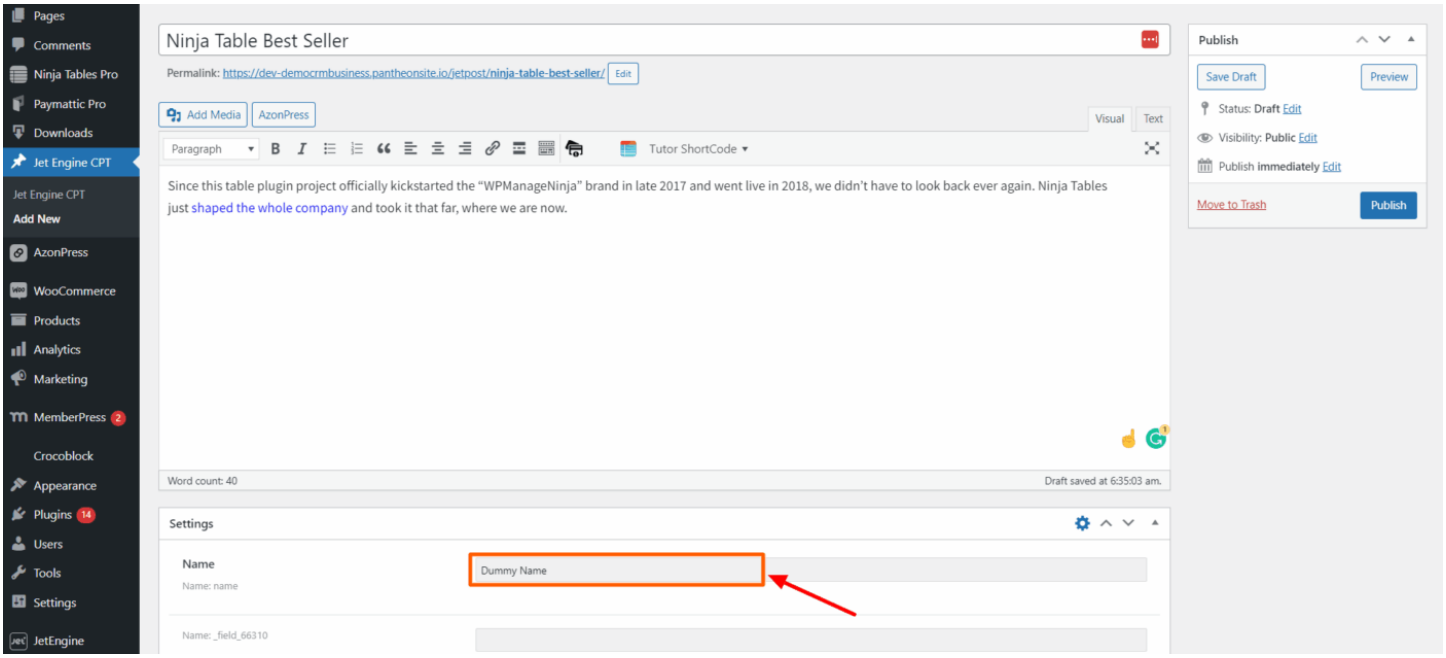

Field Type

- To get your **Post Meta Key Name,** you need to go back to **JetEngine → Post Type**.
- Then, navigate to the **Meta Fields** & here, the Name/ID of every Meta Field is Meta Key. For instance, "name" is the meta key of the Name Field as follows; the date is the Meta Key of the Date field.
- Copy the **Meta Key** to use this in a further step.
- Lastly, click on the **Add Post Type** button after your configuration is done.
- Now, go to the **Jet Engine CPT** and go to the **Add New** button.

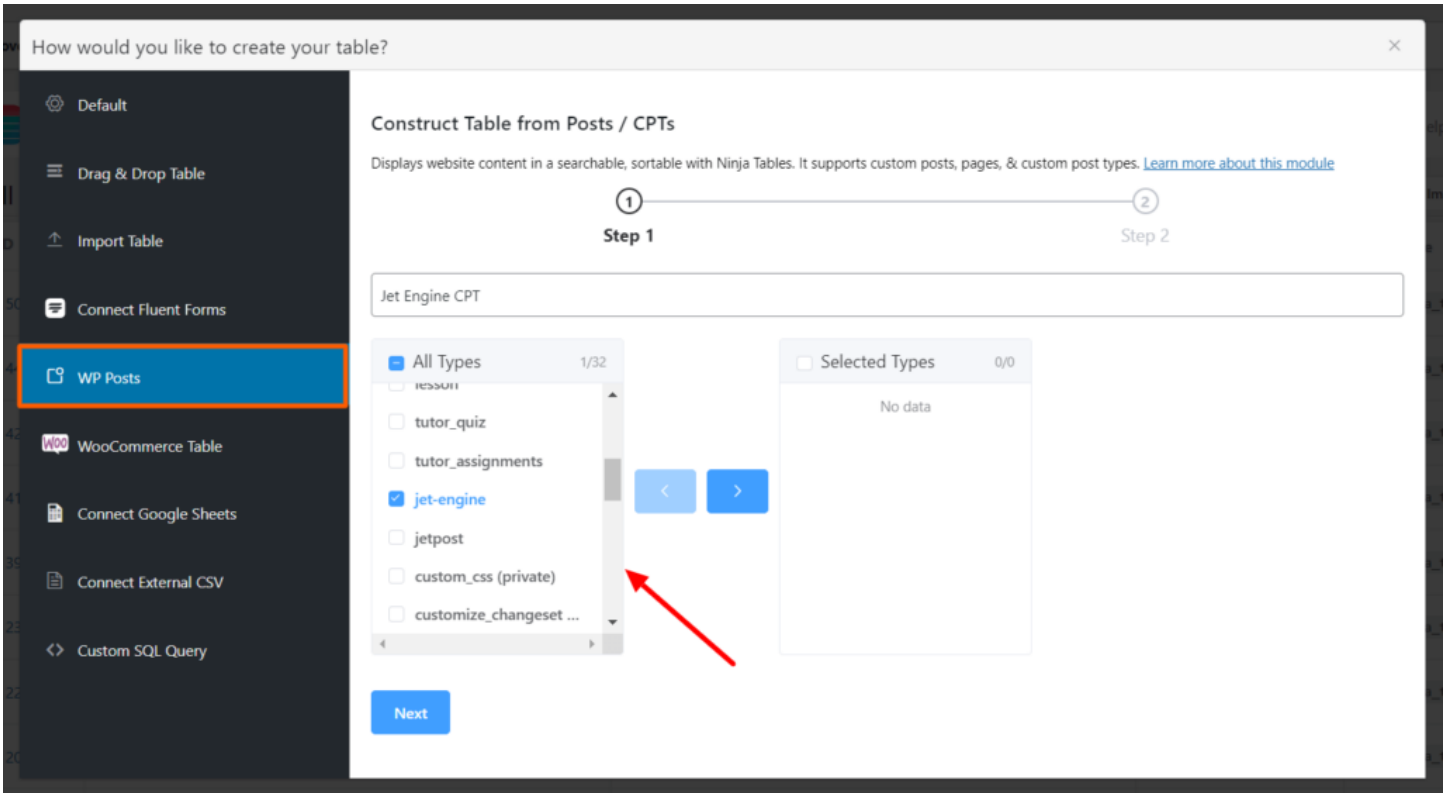

- Here, you will see the **Meta Field** has been added. Click on the **Publish** button when you are done.

Custom Post Type will work only with WP Posts & WooCommerce Table!

- Now, navigate to the **Ninja Tables** plugin and go to a **Post Table**.

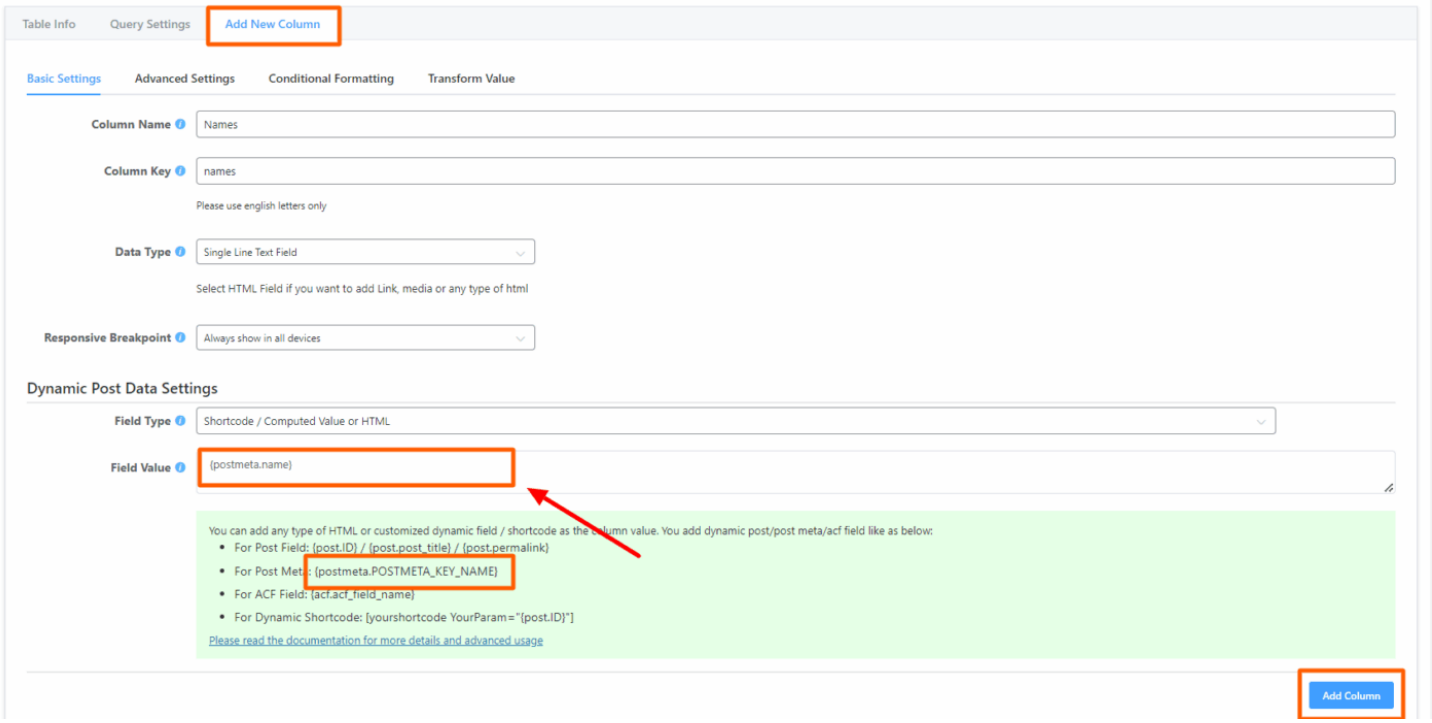

Post Table

- You must go to the Ninja Tables **Add New Column button** to add a new column when using a Custom Post field in a Custom Post Type.

- Give your Column Name and other field names.

- Choose Shortcode/Computed Value or HTML from the Field Type option in Dynamic Post Data Settings. After choosing the Shortcode/Computed value field type, some customized dynamic field values will be shown below.

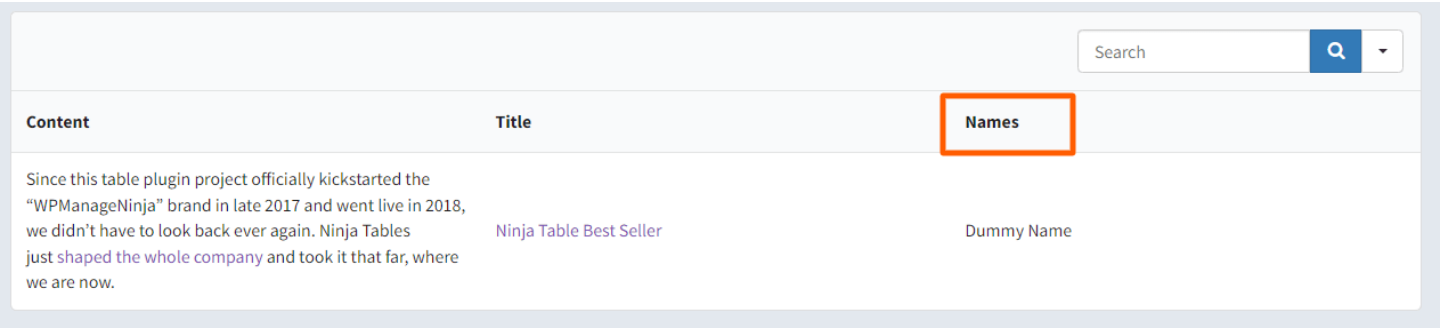

- In the Field Value option, for Post Meta, put your post meta key shortcode in the field.

Dynamic Post Data Settings

- Go back to the **Dynamic Post Data Settings**, put your **Post Meta key,** and click on the **Add Column** button.

- Then, the custom columns will be added. It will be showing up on the table like this.

Preview

By following the same steps, anyone can integrate JetEngine/ACF/Metabox/Toolset/Pods with Ninja Tables!
