Featured Image

Advanced Integration Settings (Dynamic Post Data Settings) · https://www.ninjatables.com/docs/featured-image/

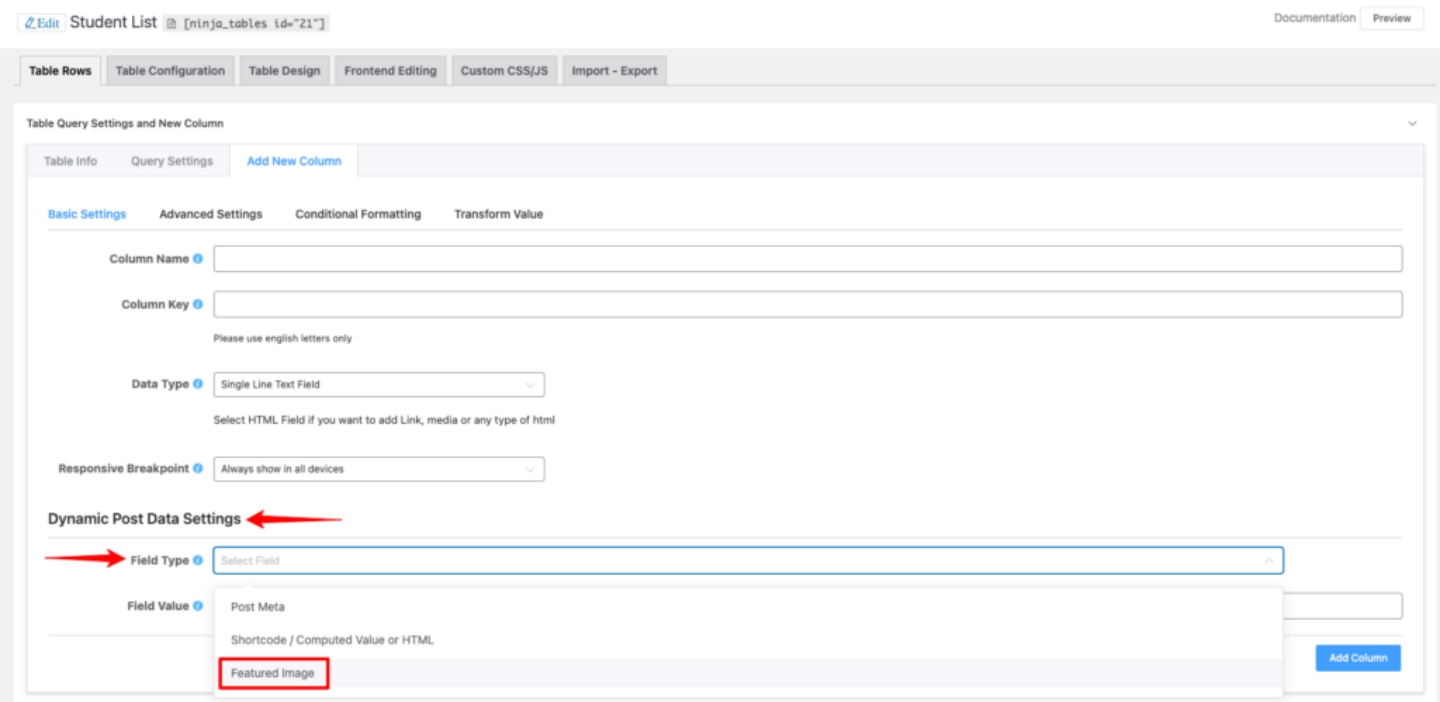

In Ninja Tables WP Posts table, you will find an option called **Featured Image** included in the **ACF** feature. To use this feature, create a table with the help of the **WP Post** option.

Let's have a look at the table below, which is created using WP Post.

- To use the **Featured Image** option**,** click on the **Add New Column** tab located beside the **Query Settings** tab. After the Add New Column is clicked, an extended drop-down will appear with a set of options.

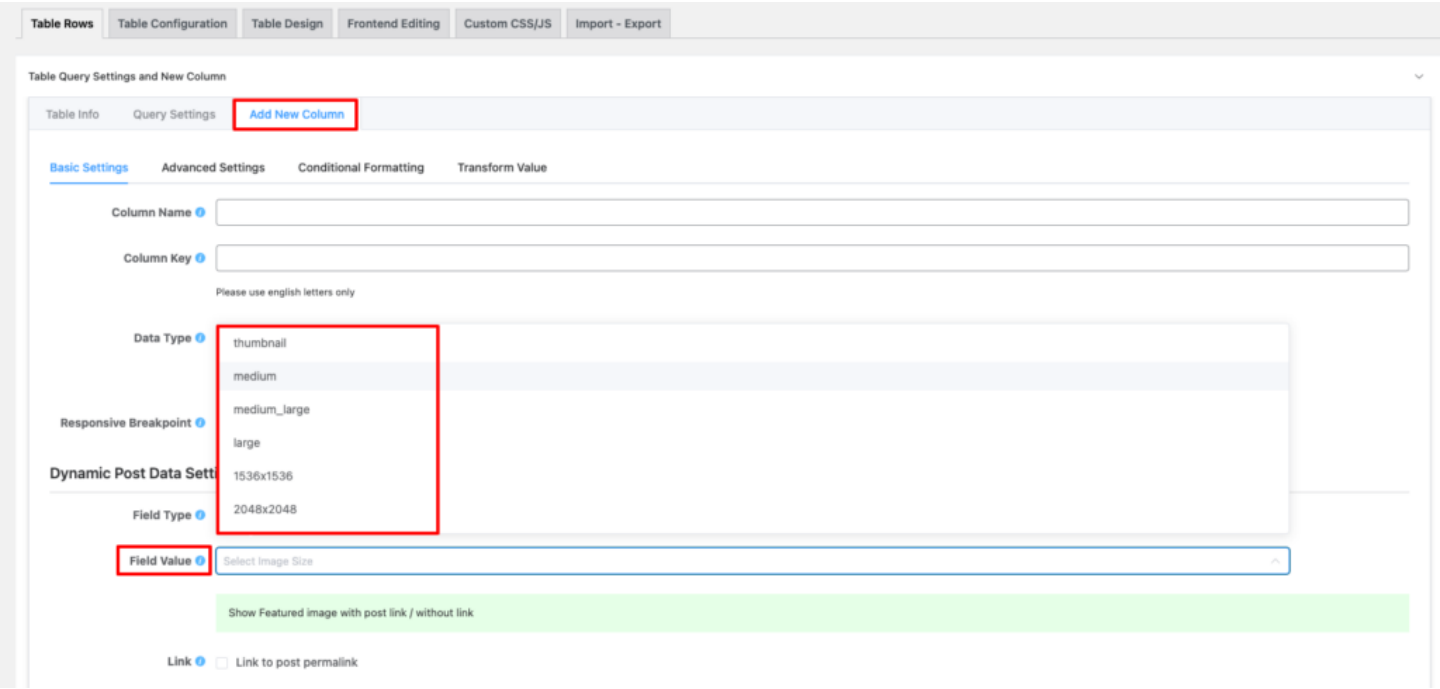

- Go to the extended popup to get this feature, here you can find a section called **Dynamic Post Data Settings**. There'll be two options for the segment, one being **Field Type** & the other being **Field Value**.

- Select the option Field Type, then the drop-down will appear. If you want to edit any featured image of your post table, just click on the **Featured Image** option.

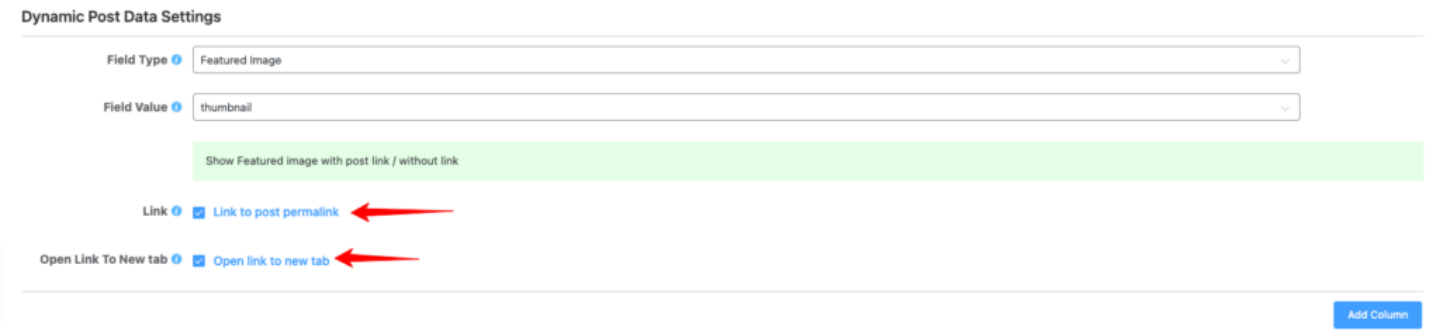

Dynamic Post Data Settings

- Next, select the **Field Value** option from the dropdown. The image can be used as a thumbnail, medium, large, etc. You can select your preferred featured image size from here.

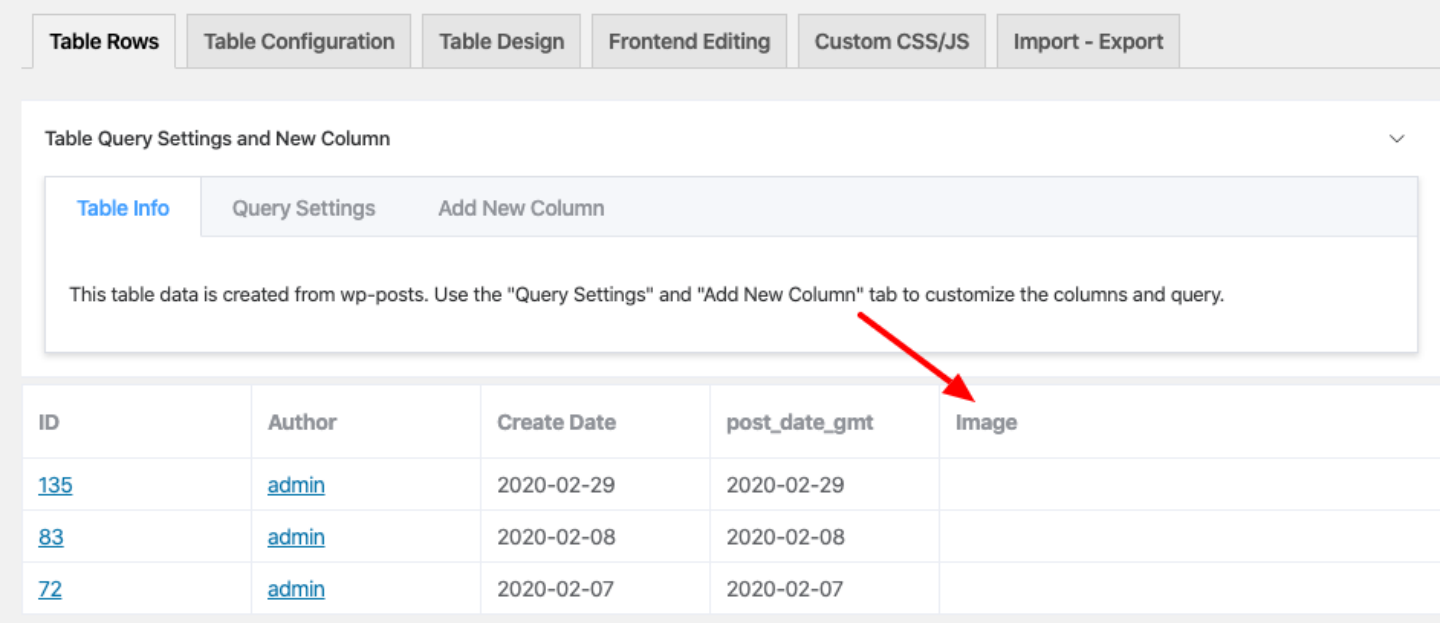

Field Value

- By checking the box you can connect the image to the post permalink and also check the Open Link To New tab to open the link to a new window.

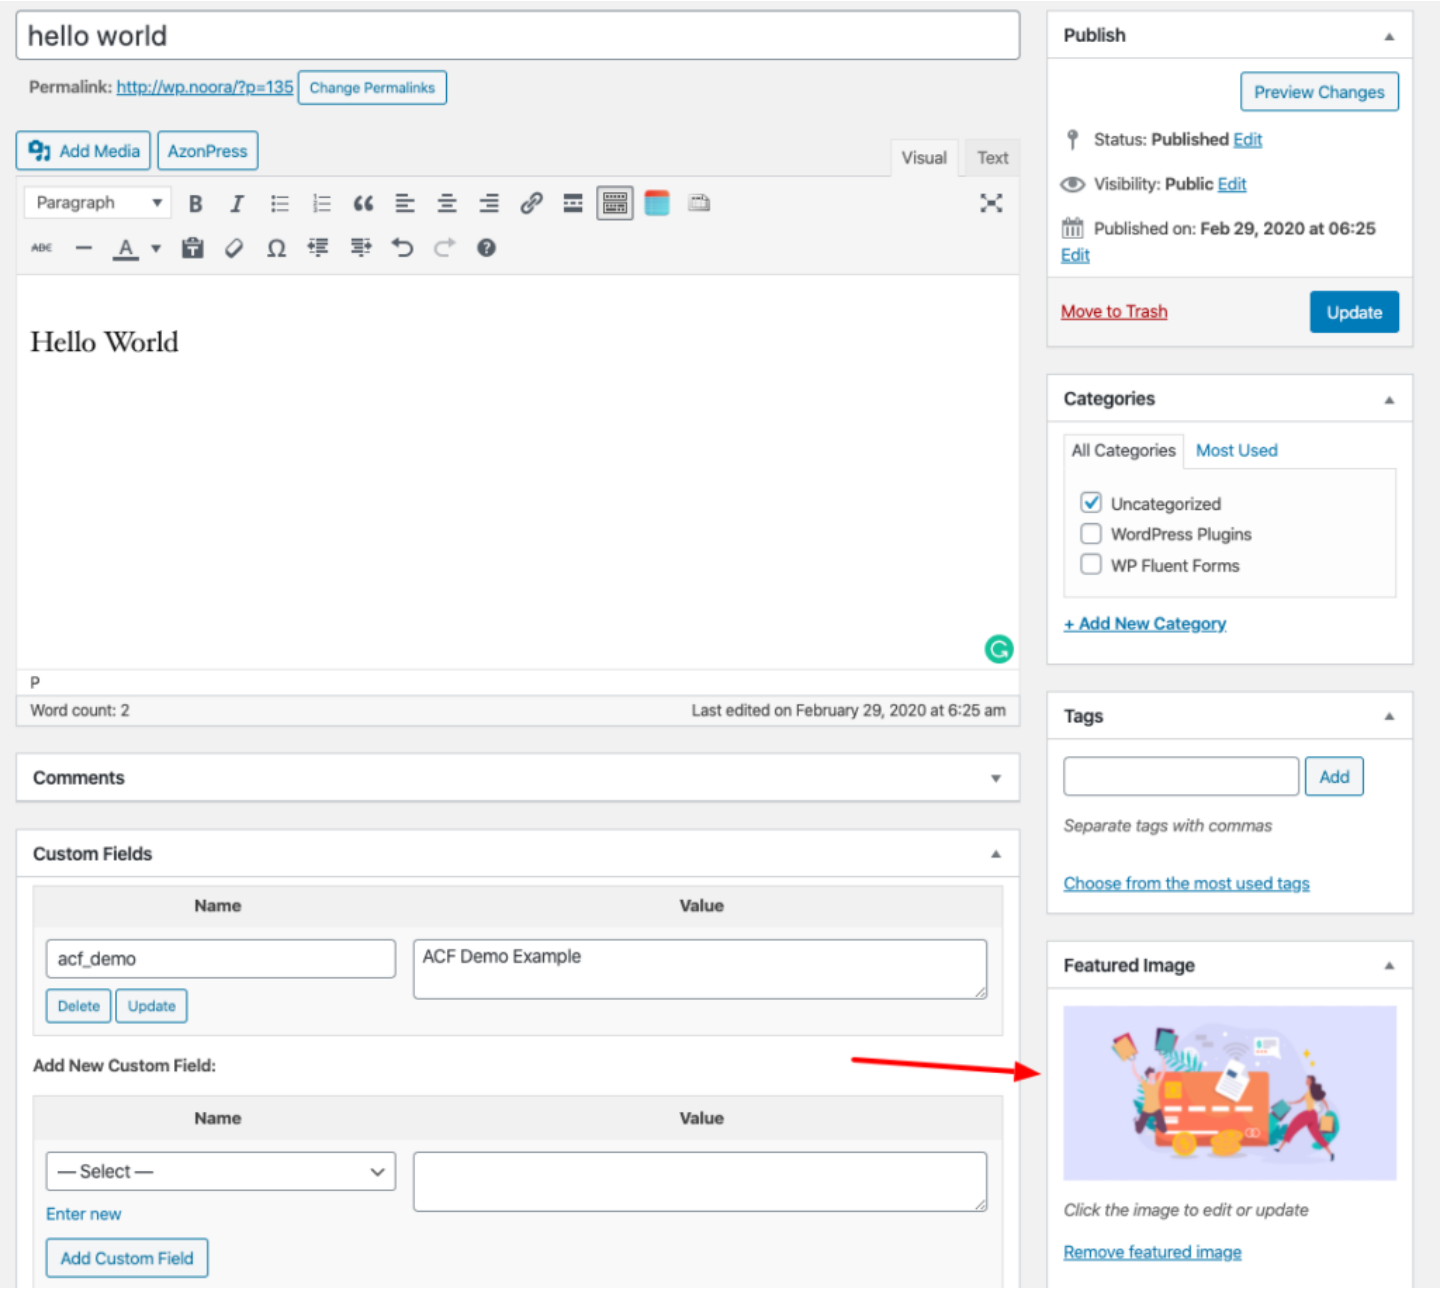

Link to post Permalink

- A column of the featured images will then appear with the featured images on your table. Here's an example – my post doesn't hold any pictures so it doesn't display anything in the image field.

Example

- Adding the feature image to a post will automatically be shown on your table’s image field. If a picture is attached to one of the posts, you can see this is included in the table you created.

- So, look at the table’s final output after the image is included in your relative post.

Search

ID	Author	Create Date	post_date_gmt	Image
135	admin	2020-02-29	2020-02-29	
83	admin	2020-02-08	2020-02-08	
72	admin	2020-02-07	2020-02-07	

This is how you can use the **Featured image** in **WP Post** table.
