Rowspan/Merge Rows

Customized Settings · https://ninjatables.com/docs/rowspan/

The **Rowspan** feature enables numerous cells of conjoining rows to be merged into a single row. Merge rows in a data table easily in Ninja Tables.

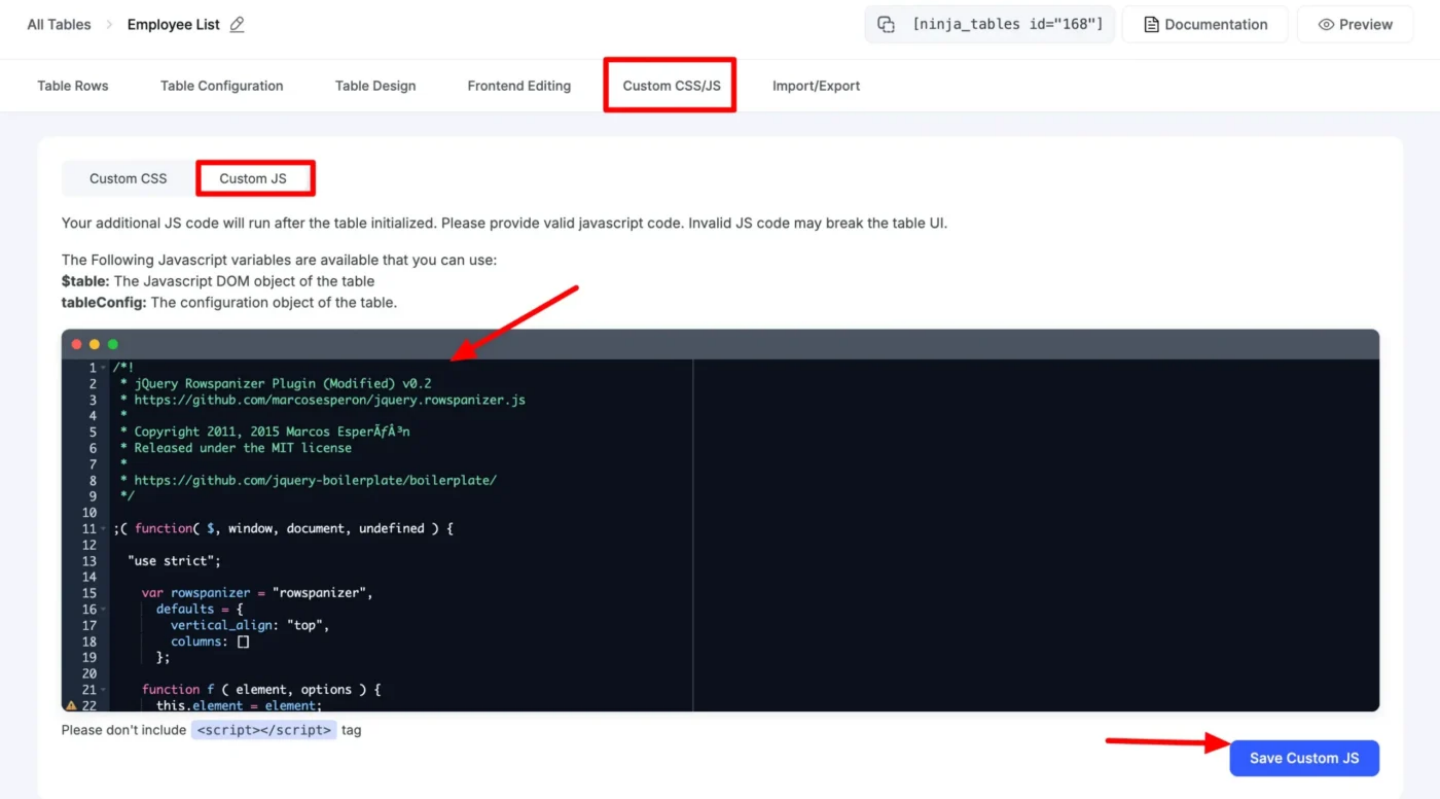

Let's dive into this simple guide to learn how to use this feature in your table.

Merge Table Rows

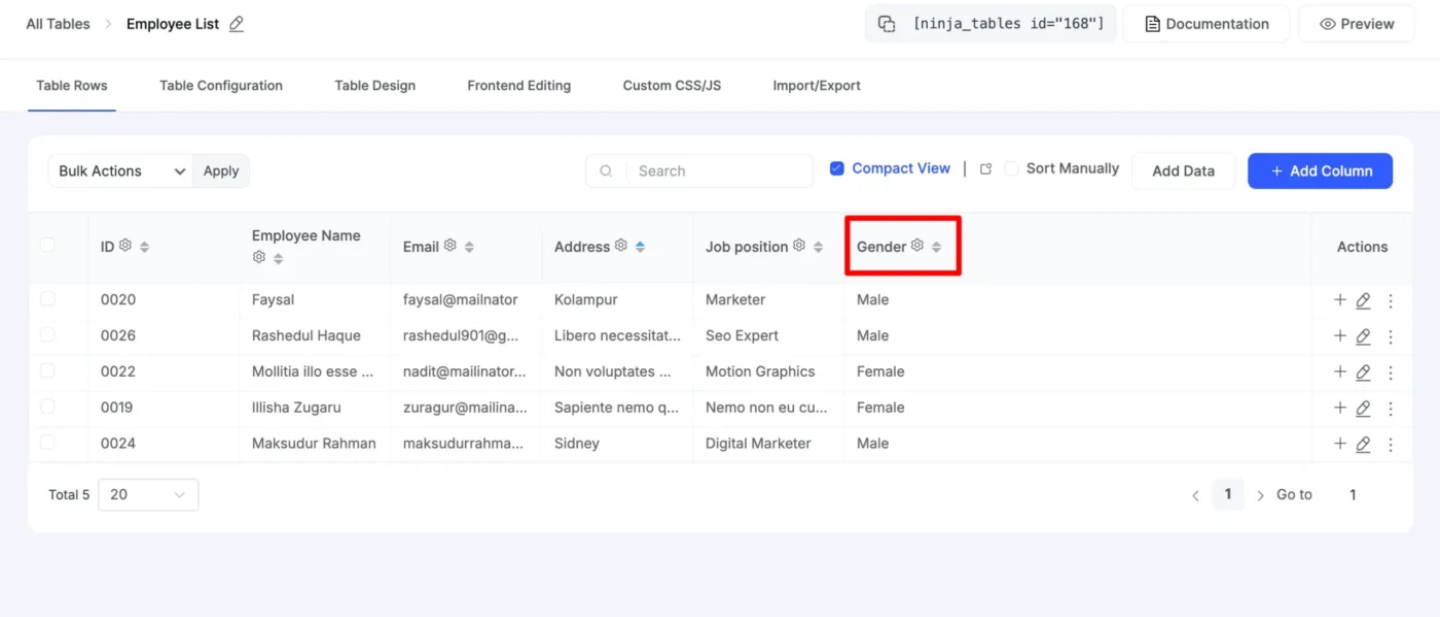

- First, go to the table where you want to apply this feature. Then go to the **Custom CSS/JS** option of the table.

- Copy and paste the code from this **file** into the **Custom Javascript** option.

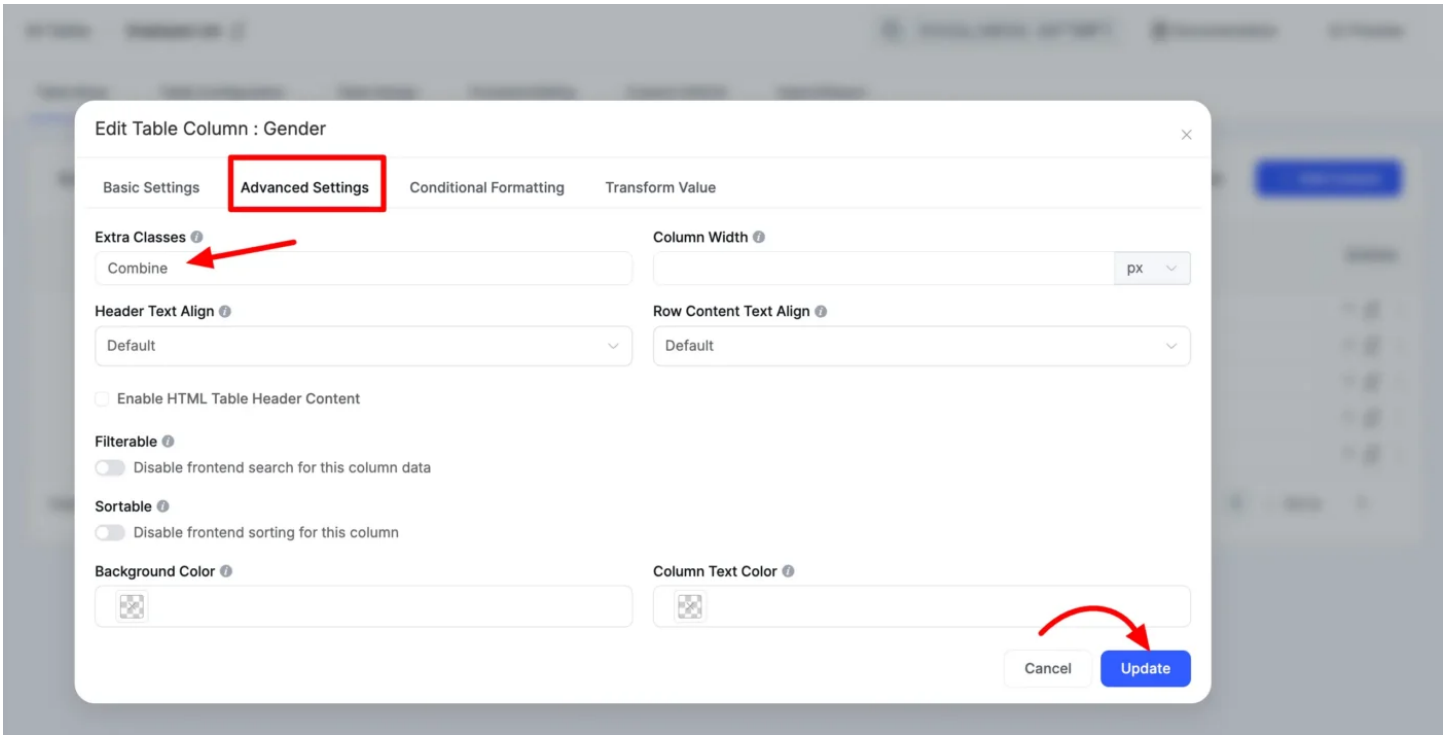

- Don't forget to click on the **Save Custom Javascript** button.

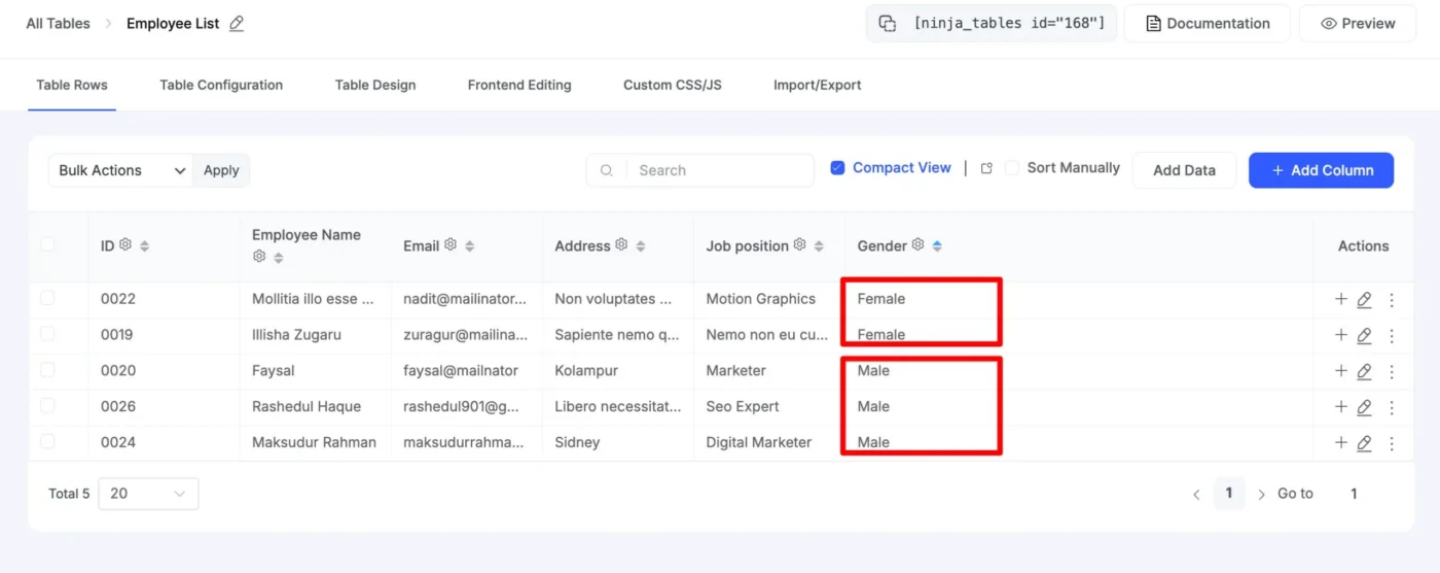

- Now, go to the table column where you want to combine two rows and click the settings button of that column.

A pop-up will arrive, select the **Advanced Settings** and type **''combine''** into the **Extra Classes** field. Click the **Update** button to save the changes.

- Now you'll see the rows containing similar data in cells will merge into one big data cell automatically.

This is how you can create a **Rowspan** in your Ninja Tables and merge table rows.
