Shortcode Element

Table Elements · https://ninjatables.com/docs/shortcode-element/

Shortcodes are codes within brackets with just a few words that allow you to execute complex codes and generate content from a single line that normally requires a lot of complex codes.

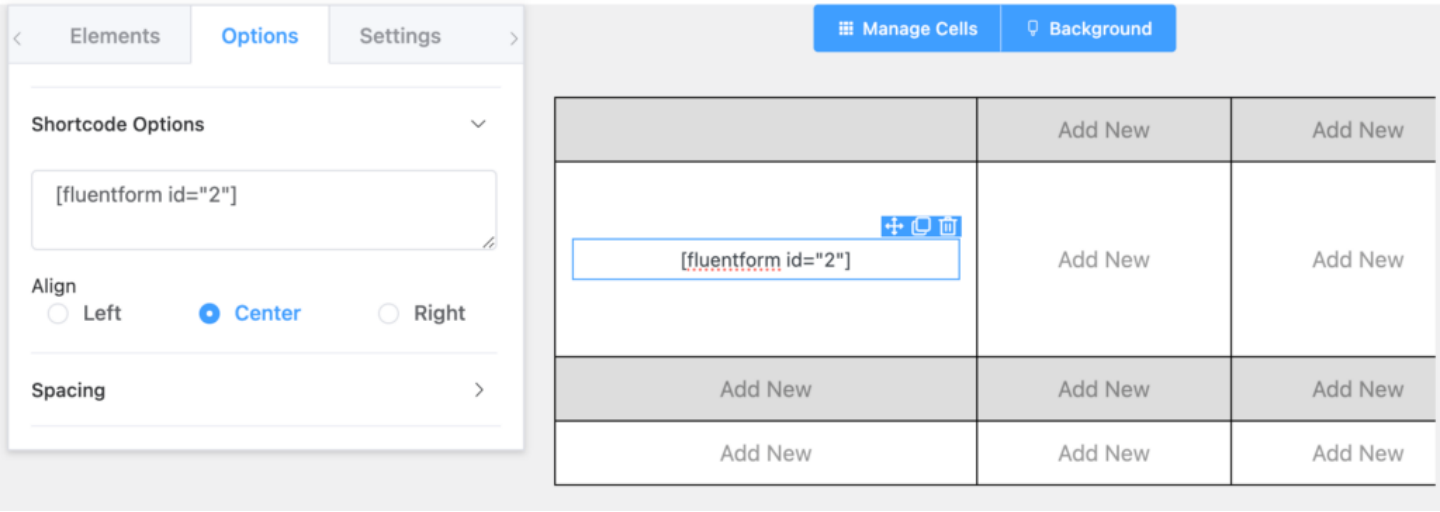

Even though a shortcode looks like a single line of text, this will not work in a Text element.

That’s why Ninja Tables offers a free shortcode element separately to let you add your shortcode to the table.

Let’s add a Shortcode element to Ninja Tables.

Properties of Shortcode Element

Option Name	Type
Shortcode Box	Text Editor Box
Alignment	Left, Center, and Right

1. **Shortcode Box:** Place your shortcode inside this field. In the example, we used a Fluent Forms shortcode for an Email Submission form.

1. **Alignment:** You can align the shortcode-generated content on either the Left, Center, or Right side of the cell.

This is how the above shortcode generates content inside the table:

	Add New	Add New	Add New
Email Address Subscribe	Add New	Add New	Add New
Add New	Add New	Add New	Add New
Add New	Add New	Add New	Add New

Conclusion

Adding a shortcode element in tables can display any shortcode-generated content you want. And drag and drop data table is a lot more flexible in this feature.

Paste any shortcode and showcase the table smartly.
